

TreasureTrail - Apple Icon Review Discussion

Summary of the conversation:

Apple rejected the app under Guideline 2.3.8 (Accurate Metadata), stating that the app icons appear to be placeholder icons. The discussion covered whether the issue was related to Apple's new Liquid Glass icon system, using Codemagic on Windows, renting a Mac in the cloud, and reviewing the current TreasureTrail icon design.

Key Points

- Apple's rejection appears to be about placeholder or inconsistent icons, not necessarily Liquid Glass support.
- Icon Composer currently requires macOS and cannot be run natively on Windows.
- Cloud Mac services such as MacinCloud and MacStadium were discussed.
- The uploaded TreasureTrail icon was reviewed and feedback was provided.
- A message to Apple App Review was drafted requesting clarification and guidance for Windows/Codemagic developers.

Draft Message to Apple

Hello App Review Team,

Thank you for your feedback regarding Guideline 2.3.8. We have reviewed our app icon assets and are working to ensure all icons are finalized and consistent across the App Store listing and all supported devices. We would appreciate clarification regarding which icon asset appears to be a placeholder icon and whether a screenshot could be provided.

Additionally, we develop our application using a Windows PC and use Codemagic for building and distributing our iOS app. We do not have access to Xcode or Apple's Icon Composer, which currently require macOS.

If the issue is related to newer icon requirements, could you please advise whether there is a recommended workflow or alternative method for developers using Windows-based environments?

Thank you for your assistance.
